FLIGHT DATA MANAGEMENT COURSE

Flight Data Management (FDM) helps pilots, managers and operators improve the safety and efficiency of their flights by identifying hidden flaws and potential risks in their daily operations.

FDM uses routine information from normal flights to predict and prevent problems to pre-empt disaster. It is a change away from waiting for a catastrophic failure to reveal problems with standardized procedures, equipment, and systems.

FDM helps operators and pilots learn the lessons of their next accident before that accident has a chance to occur

FDM is now also coming to the world of Cessna Caravans & Jetstreams. This unique in-region course will provide you with a solid appreciation of the technical, operational, management and legal issues surrounding FDM. It will prepare you for your next career move.

Make your operations data driven - learn about flight data management

Who must attend?

- Pilots & trainee pilots
- Flight safety officers
- Regulators
- Aircraft maintenance companies
- Airline union representatives
- Accident investigators
- Aircrew representatives
- Aviation students

Course highlights:

- FDM & safety management
- Towards a successful FDM program
- Fitting out aircraft
- FDM technology
- Human factors of FDM
- Visualisation

**\$350 for
2 days**
